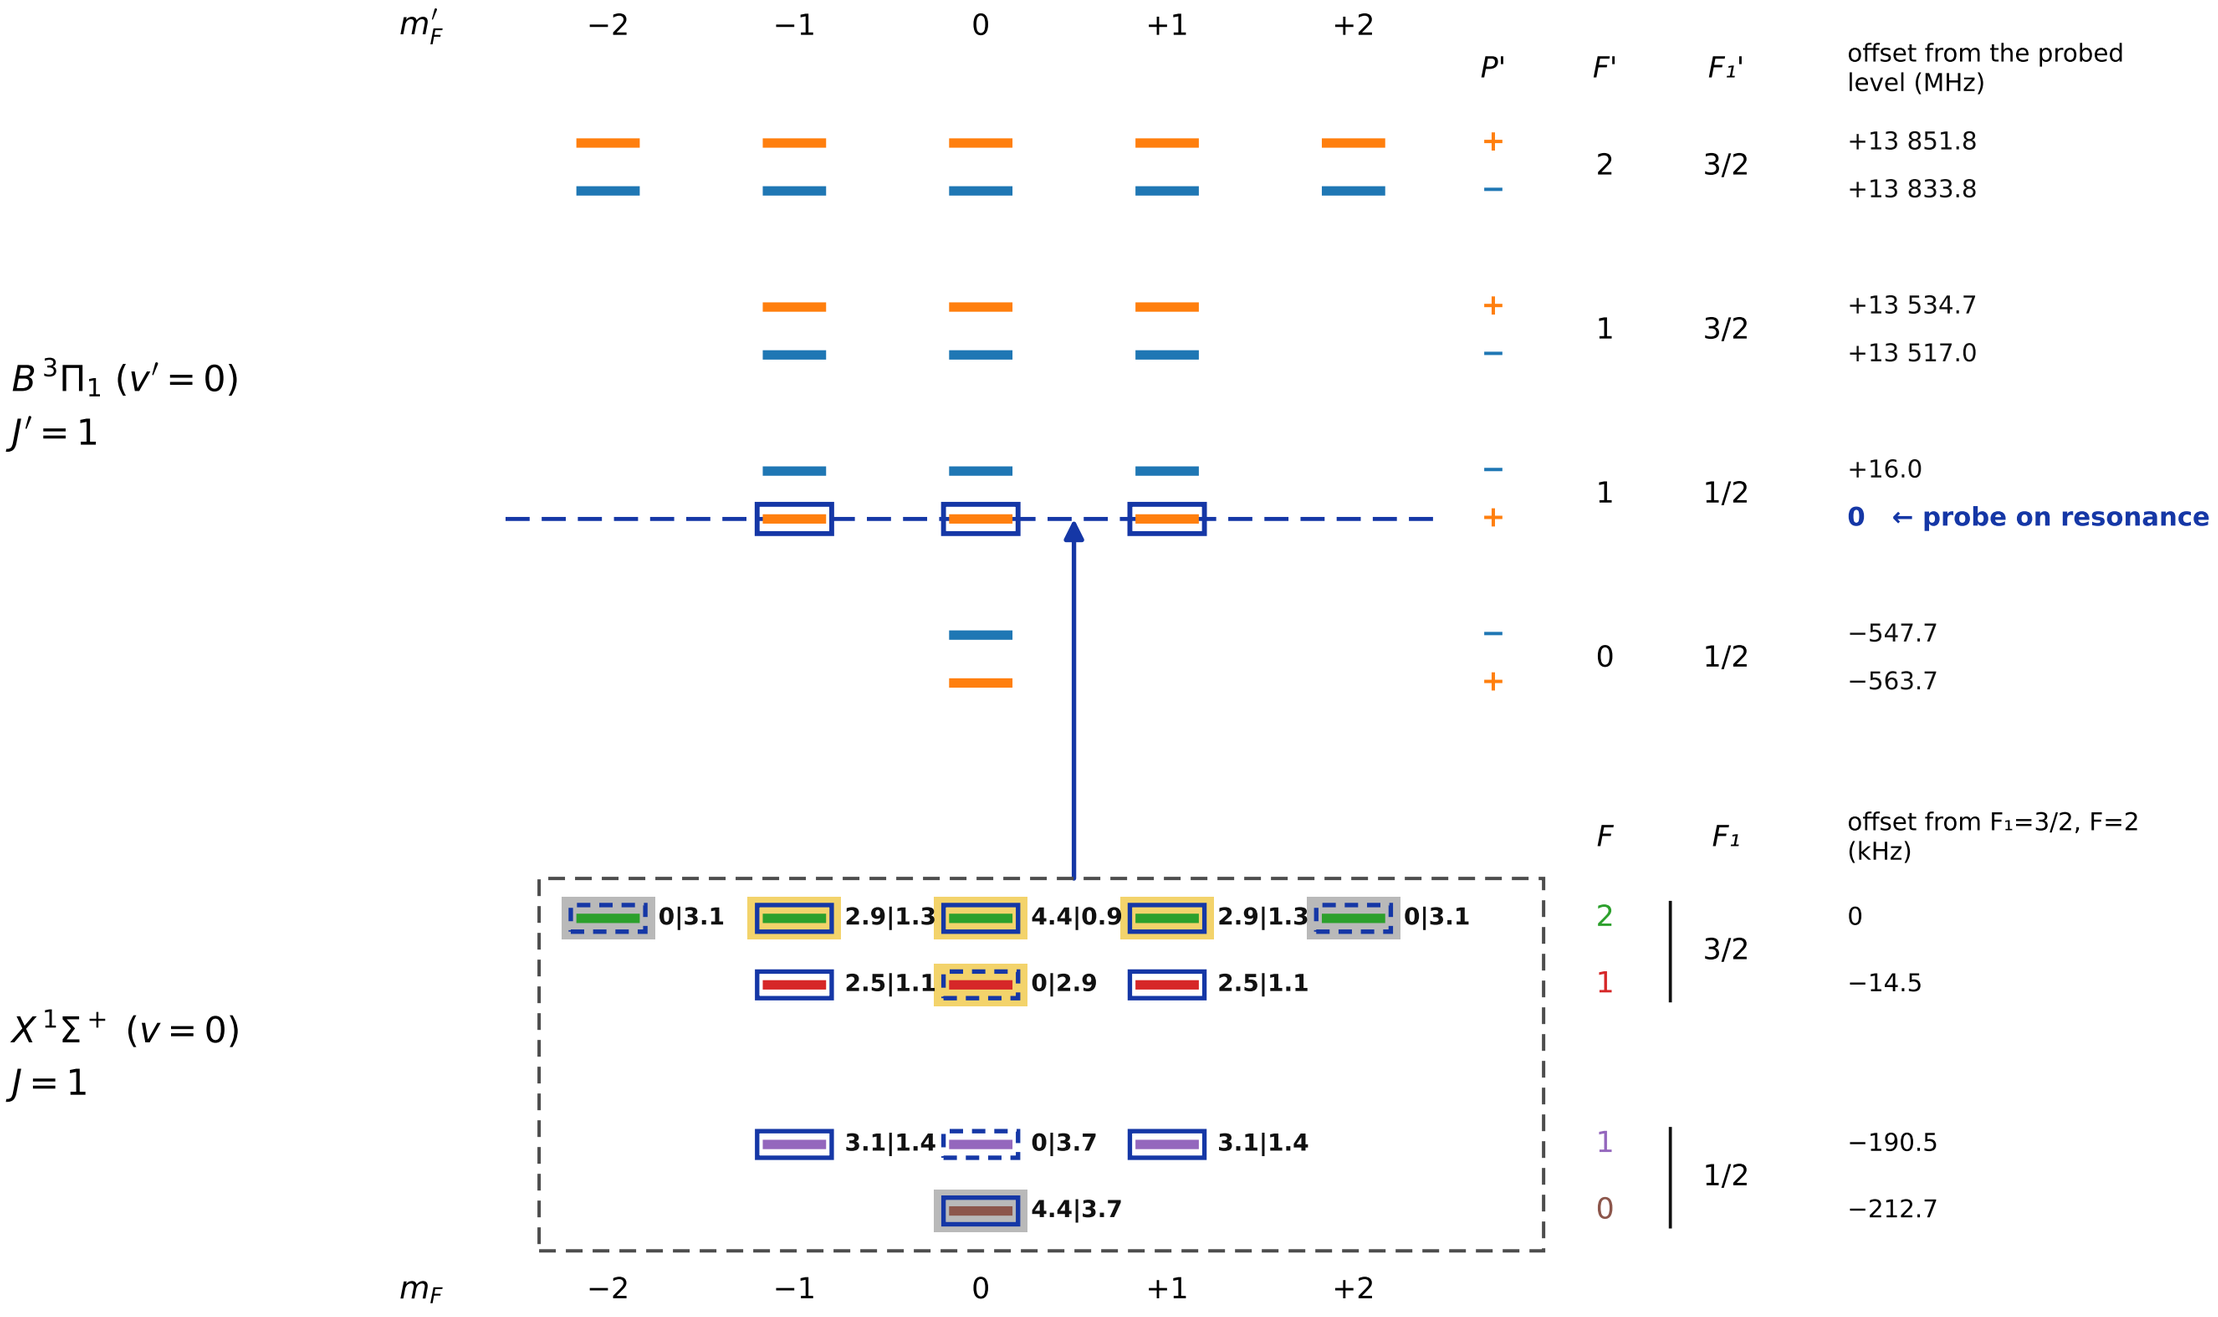
Detection | Q(1) F₁'=1/2, F'=1 | E = 0 | probe 2.5 cm × 1.7 cm, single frequency



Blue dashed line: probe on resonance with |F₁'=1/2, F'=1, P'=+⟩, single frequency, fixed linear polarization; blue boxes on B: driven.
Number at each J=1 sublevel: photons per molecule, saturated (50 mW/cm² peak, probe centre, vx = 0), polarization ∥ | ⊥ to the molecules' quantization axis (⊥ approximate). Solid box: detected for both; dashed: only for ⊥.
3 excited vs 12 ground sublevels: fixed polarization leaves dark states. F=0 is never dark.
Yellow: populated with CU1 off (AP1). Grey: where the CU1 residual sits (32 % F=0, 64 % F=2, m_F=±2; +19.0 MHz).
Levels in energy order, not to scale; right columns: offsets in MHz (B) and kHz (X).
