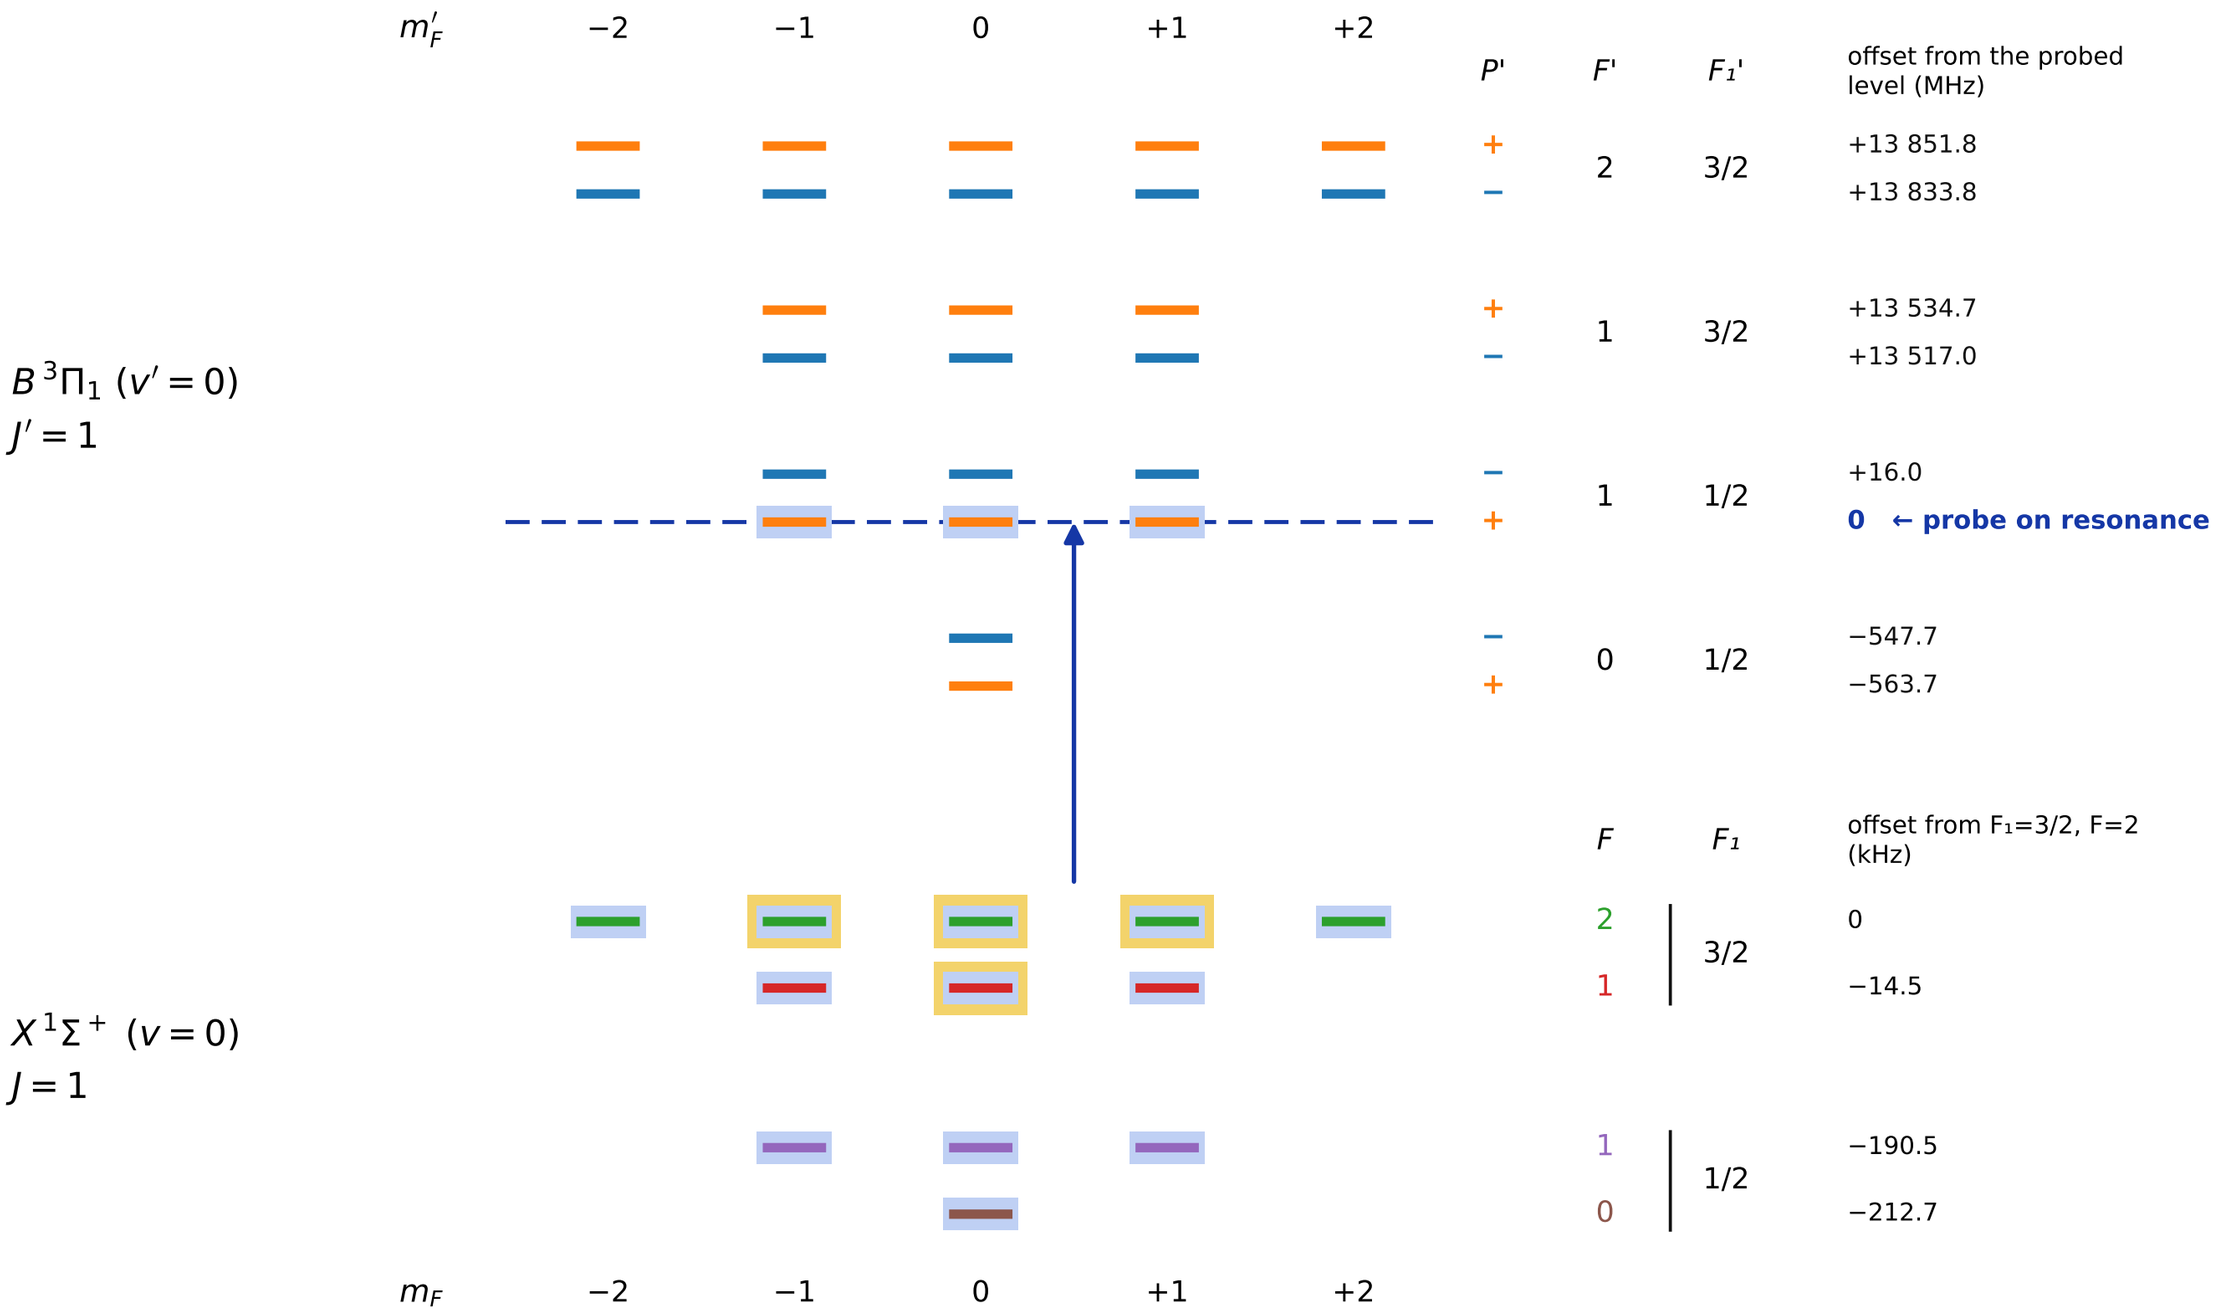
Detection | Q(1) F₁'=1/2, F'=1 | E = 0 | probe 1.5 cm high, single frequency, x polarization



Blue dashed line: probe on resonance with |F₁'=1/2, F'=1, P'=+⟩, single frequency, x polarization (along the beamline, ⊥ the CU1 field).
Blue highlight: sublevels that couple to the probe (on B: driven; on J=1: excited by the probe).
12 ground vs 3 excited sublevels: dark states form during detection, so the signal per molecule depends on the sublevel.
Yellow: populated with CU1 off (AP1).
Levels in energy order, not to scale; right columns: offsets in MHz (B) and kHz (X).
